To improve the expression of rCOP-1 polypeptides in E. coli, genes coding for rCOP-1-19 were subcloned from pRBV 2.1 to pBG3-2deltaN (deposit: 20-NOV-1984 US4691009, NRRL B-15910), a plasmid used to express Protein A. The resulting plasmids encode fusion proteins consisting of beta-cocurs between the Protein A and rCOP-1 sequences. A methionine residue cocurs between the Protein A and rCOP-1 sequences. A methionine residue from the fusion protein. rCOP-1 sequences. A methionine residue from the fusion protein. rCOP-1-19 contains oligonucleotide duplexes incoding the following segments: YKK, AAE, KAA, KKA, YEA, AKA KEA, incoding the following residue is left behind following CNBr cleavage of the fusion protein. The product prevents or arrests experimental autcoimmune encephalomyelitis. They are used to prevent. The rest or control a demyelinating disorder, e.g. multiple sclerosis. They may also be used as additives to hair care products to confer beneficial effects on damaged hair or as supplements for diete deficient in certain conference.
                Recombinant copolymer 1; COP-1-19; myelin basic protein; MBP; immunological activity; autoimmune encephalomyelitis; multiple sclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1 AKKYAKKEKAYAKKAEKAAKKAE------AKAYKAAEAKKKAEAKYKAEAAKA 47

                                                                                           Wang L,
Wall D,
    the foll anticense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a prointeration of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding antisense nucleic acid; (4) an antibody capable of specifically binding colliferation or the activity of a gene in an operon required for proliferation, (7) identifying a compound that influences the activity of a gene in an operon required for che gene product or that has an activity against a biological pathway required for proliferation for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product is open equired for cellular proliferation of an organism acts; (9) manufacturing an antibiocic; (10) profiling a compound sectivity; (11) aculture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent or organism acts; (9) manufacturing an antibiocic; (10) profiling a compound sectivity; (11) a culture compound that inhibits proliferation of an organism. The antisense nucleic acids are useful for the which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for derugived for proliferation in cells other than S, aureus, S, typhimurium, CC for cellular proliferation in cells other than S, aureus, S, typhimurium, a part of the printed specification, but was obtained to patent did not form part of the printed specification, but was obtained to make the propersor of the printed specification, but was obtained to make the 
                                              invention relates to an isolated nucleic acid comprising any one of

expressed from the genome sequence of the present invention. Proteins expressed from the genome sequence are useful for raising specific antibodies, identification of L. monocytogenes and related organisms, and for biosynthesis and biodegradation, especially biosynthesis of Vitamin B12. The genome sequence and proteins encoded by it are also useful for and modulate L. monocytogenes-related diseases. In addition, the genome sequence and proteins encoded by it are useful in pharmaceutical and woachines compositions for the treatment or prevention of infections by L. monocytogenes and related organisms. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

screening

```
drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at from the properties of the printed specification, but was obtained ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to the genome sequence of Listeria monocytogenes EGD-e (see ABA03041). The genome sequence and fragments of it are useful for selecting probes and primers for detecting genes in L. monocytogenes and related organisms, and for studying genetic polymorphisms and other genomes. The present sequence is a protein
                                                                                                                                                                                                                                                                                                                                     25
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Genomic sequence for Listeria monocytogenes, useful e.g. for treatment and prevention of Listeria and related bacterial infections, and related polypeptides.

Protein encoded by Prokaryotic essential gene #25712.

```
the invention fraintes to an instance and compitating any one of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated containing the vector; (3) an isolated of polypeptide of its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting callular contiferation or the activity of a gene in an operon required for proliferation, (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation, (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation and that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound that inhibits proliferation of the strains is present in a culture or collection of compound activity; (11) a culture comprising strains in which the extent or or which each of the strains is present in a culture or collection of confidentifying proteins or screening for homologous nucleic acids required for proliferation of an organism. The antisense nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, contained for proliferation in cells other than S. aureus, S. typhimurium, contained to the printed specification, but was obtained to the print of the printed specification, but was obtained to the print of the printed specification, but was obtained to the properation of the printed specification, but was obtained to the properation of t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                             Antisense; prokaryotic essential gene; cell proliferation; drug design.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an isolated nucleic acid comprising any

Zyskind JW; Xu HH;

Ohlsen KL, Forsyth RA,

or screening New antisense nucleic acids, useful for identifying proteins or scre for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.

Claim 25; SEQ ID NO 67145; 1766pp; English.

the nucleic acid inhibits proliferation of a cell. Also included are:

the foll antieense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

the comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense concleic acid; (2) a host cell contaming the vector; (3) an isolated continued by the antisense contest acid; (4) an antibody capable of specifically binding cantisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting callular continued for proliferation or the activity of a gene in an operon required for proliferation; (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway or that has an activity against a biological pathway or the proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound activity; (11) a culture comprising strains in which the est compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound activity; (11) a culture comprising strains in which the est compound that inhibits the extent or organism; or (13) identifying the target of a compound that inhibits the contest of compounds activity; (11) a culture compounds activity; (12) determining the extent or product is overexpressed or underexpressed; (12) determining the extent or to which each of the strains is present in a culture or collection of proliferation of an organism. The antisense mucleic acids are useful for dentifying proteins or screening for homologous nucleic acids are useful for each of its organism. The antisense andidate model or activity activity in the province condition or an organism. The antisense andidate model or activity of the strains is drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, R. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at The invention relates to an isolated nucleic acid comprising any tp.wipo.int/pub/published_pct_sequences osteopathic; immunosuppressive; antithyroid; antiinflammatory;

                                                                                                                                                                                                                                                                                                                                    AAY AAV82571 to AAV82577 represent specifically claimed copolymer molecular weight TV-marker polypeptides (1) for determining the molecular weight invention describes polypeptides (1) for determining the molecular weight of a copolymer (CP), which has an identified molecular weight and an amino acid composition corresponding to the copolymer. The polypeptides of the invention are used as molecular weight markers for glatiramer accetate related tetrapolymers. The polypeptides may also be used for treating and preventing immune diseases in a mammal. Autoimmune diseases which may be treated include either cell-mediated or antibody-mediated diseases. Such diseases include arthritic conditions, demyelinating diseases and inflammatory conditions, e.g. multiple sclerosis, rheumatory conditions, e.g. multiple sclerosis, rheumatory conditions, e.g. multiple sclerosis, crontact cophoritis, autoimmune haroimmune haemolytic anaemia, autoimmune cophoritis, autoimmune throndomytopaenia purpura, colitis, contact sensitivity disease, diabetes mellitus, Graves disease, Guillain-Barre's syndrome, Hashimoto's disease, idiopathic mysocedema, myashhania gravis, contact sensitivity disease, which can be treated include host-versus-graft disease, chronic immune thrombocytopaenia purpura, colitis, contact mediated diseases which can be treated include host-versus-graft disease, colypeptides of the invention have defined molecular weights and physical properties which are analogous to glatiramer accetate molecules, which makes them ideal for use as molecular weight markers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1 AKKYAKKABKAYAKKAKAAKEKKAYAKKEAKAYKAAEAKKKAKAKAEAKKYAKEA 60
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  glatiramer acetate; autoimmune disease; antiarthritic; neuroprotective;
                                                                                                                                                                                                                                                                 Copolymer 1 related polypeptides used as molecular weight markers for glatiramer acetate and for treatment and prevention of immune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Copolymer molecular weight TV-marker amino acid sequence SEQ ID NO:2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   53;

AAY82571 to AAY82577 represent specifically claimed copolymer molecular weight TV-marker polypeptides from the present invention. The present invention describes polypeptides (1) for determining the molecular weight of a copolymer (2), which has an identified molecular weight and an amino acid composition corresponding to the copolymer. The polypeptides of the invention are used as molecular weight markers for glatiramer acetate related tetrapolymers. The polypeptides may also be used for treating and preventing immune diseases in a mammal. Autoimmune diseases which may be treated include either cell-mediated or antibody-mediated diseases and inflammatory conditions, e.g. multiple sclerosis, rheumatoid arthritis, osteoarthritis, autoimmune hapenolytic anaemia, autoimmune cophoritis, autoimmune thyroididits, autoimmune uveorefinitis, contact sensitivity disease, chromic immune thrombocytopaenia purpura, colitis, contact sensitivity disease, diabetes mellitus, Graves disease, Guillain-Barre's syndrome, Hashimoto's disease, idiopathic myxoedema, myasthenia gravis, psoriasis, pemphigus vulgaris, or systemic lupus erythematosus. Mediated, mediated diseases which can be treated include host versus-graft disease, and delayed-type hypersensitivity. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        polypeptides of the invention have defined molecular weights and physical properties which are analogous to glatiramer acetate molecules, which makes them ideal for use as molecular weight markers

which to marker polypeptides from the present invention. The present invention describes polypeptides (1) for determining the molecular weight of a copolymer (CP), which has an identified modecular weight and an amino acid composition corresponding to the copolymer. The polypeptides of the invention are used as molecular weight markers for glatizamer catetate related tetrapolymers. The polypeptides may also be used for treating and preventing immune diseases in a mammal. Autoimmune diseases which may be treated include either cell-mediated or antibody-mediated diseases include arthritic conditions, demyelinating diseases. Such diseases include arthritic conditions, demyelinating cophoritis, autoimmune thyroiditis, autoimmune haemolytic anaemia, autoimmune cophoritis, autoimmune thyroiditis, autoimmune uveoretinitis, corhoric sensitivity disease, diseases militums faraves disease, chronic immune thrombocytopaenia purpura, colitis, contact sensitivity disease, disease, disease mellitums Graves disease, graft-versus-host disease, uidopathic myxoedema, myasthenia gravis, psoriasis, pemphigus vulgaris, or systemic lupus erythematosus. Mediated mediated diseases, which can be treated include host-versus-graft disease, graft-versus-host disease, and delayed-type hypersensitivity. The gropperties of the invention have defined molecular weights and physical properties which are analogous to glatiramer acetate molecules, which markers makes them ideal for use as molecular weight markers
                                                                                                                                                                                                                     AAY82571 to AAY82577 represent specifically claimed copolymer molecular

Copolymer 1 related polypeptides used as molecular weight markers for glatiramer acetate and for treatment and prevention of immune diseases.

Claim 10; Page 14; 72pp; English.

AAY92571 to AAY82577 represent specifically claimed copolymer molecular weight TV-marker polypeptides from the present invention. The present invention describes polypeptides (1) for determining the molecular weight of a copolymer (CP), which has an identified molecular weight and an amino acid composition corresponding to the copolymer. The polypeptides of the invention are used as molecular weight markers for glatiramer cactate related tetrapolymers. The polypeptides may also be used for actating and preventing immune diseases in a mammal. Autoimmune diseases cactate related tetrapolymers. The polypeptides may also be used for treating and preventing immune diseases in a mammal. Autoimmune diseases which may be treated include either cell-mediated or antibody-mediated diseases such diseases include arthritic conditions, demyelinating diseases and inflammatory conditions, e.g. multiple sclerosis, rheumatoid arthritis, osteoarthritis, autoimmune haemolytic anaemia, autoimmune cophoritis, autoimmune thyroidmines, e.g. multiple sclerosis, crontact arthritis, osteoarthritis, autoimmune thyroidmines, e.g. multiples sclerosis, crontact cophoritis, autoimmune thyroidmines, e.g. multiples sclerosis, contact cophoritis, autoimmune thyroidmines, e.g. multiples sclerosis, disease, diabetes mellitus, Graves disease, Guillain-Barre's syndrome, Hashimoto's disease, idiopathic mysoedema, mysathenia gravis, psoriasis, pemphigus vulgaris, or systemic lupus erythematosus. Mediated cophoriasis, pemphigus vulgaris, or systemic lupus erythematosus. Mediated cophoriamis nost disease, and delayed-type hypersensitivity. The properties which are analogous to glatiramer acetate molecules, which are analogous to glatiramer acetate molecules, which are an

Copolymer 1 related polypeptides used as molecular weight markers for glatiramer acetate and for treatment and prevention of immune diseases

Claim 10; Page 14; 72pp; English.

AAY82571 to AAY82577 represent specifically claimed copolymer molecular weight TV-marker polypeptides from the present invention. The present invention describes polypeptides (I) for determining the molecular weight of a copolymer (CP), which has an identified molecular weight and an amino acid composition corresponding to the copolymer. The polypeptides

```
cetate related tetrapolymers. The polypeptides may also be used for treating and preventing immune diseases in a mammal. Autoimmune diseases which may be treated include either cell-mediated or antibody-mediated diseases. Such diseases include either cell-mediated or antibody-mediated diseases. Such diseases include atthritic conditions, demyelinating diseases and inflammatory conditions, e.g. multiple sclerosis, rheumatoid arthritis, osteoarthritis, autoimmune haemolytic anaemia, autoimmune arthritis, osteoarthritis, autoimmune haemolytic anaemia, autoimmune cooporitis, autoimmune thrombocytopaenia purpura, colitis, contact sensitivity disease, diabetes mellitus, Graves disease, Guillain-Barre's syndrome, Hashimoro's disease, idiopathic mycodema, myasthenia gravis, psoriasis, pemphigus vulgaris, or systemic lupus erythematosus. Mediated mediated diseases which can be treated include host-versus-graft disease, graft-versus-host disease, and delayed-type hypersensitivity. The polypeptides of the invention have defined molecular weights and physical properties which are analogous to glatiramer acetate molecules, which makes them ideal for use as molecular weight markers
the invention are used as molecular weight markers for glatiramer

AAY82571 to AAY82577 represent specifically claimed copolymer molecular weight TV-marker polypeptides from the present invention. The present invention describes polypeptides (1) for determining the molecular weight of a copolymer (CP), which has an identified molecular weight and an amino acid composition corresponding to the copolymer. The polypeptides of the invention are used as molecular weight markers for glatiramer cof the invention are used as molecular weight markers for glatiramer cactate related terrapolymers. The polypeptides may also be used for treating and preventing immune diseases in a mammal. Autoimmune diseases cactate related terrapolymers. The polypeptides may also be used for treating and preventing immune diseases include atther cell-mediated or antibody-mediated diseases and inflammatory conditions, e.g. multiple sclerosis, rheumatory conditions, e.g. multiple sclerosis, rheumatory conditions, e.g. multiple sclerosis, contact disease, chronic immune thyroidmine, e.g. multiple sclerosis, contact coophoritis, autoimmune thyroidmine, graves disease, disease, diabetes mellitus, Graves disease, Guillain-Barre's syndrome, Hashimoto's disease, idiopathic mysocedema, myashhania gravis, contact sensitivity disease, diabetes mellitus, Graves disease, Guillain-Barre's psoriasis, pemphigus vulgaris, or systemic lupus erythematosus. Mediated mediated diseases which can be treated include host-versus-graft disease, and delayed-type hypersensitivity. The properties which are analogous to glatiramer acetate molecules, which makes them ideal for use as molecular weight markers
                                                                                                                                                                     Copolymer 1 related polypeptides used as molecular weight markers for glatiramer acetate and for treatment and prevention of immune diseases.
                                                                                                                                                                                                                                                          Claim 10; Page 14; 72pp; English.

The invention relates to an isolated nucleic acid comprising any one of the fall antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are: (1) a vector comprising a promoter operably linked to the nucleic acid of the nucleic acid, (2) a host cell containing the vector; (3) an isolated or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding oplypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding cell polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway required for proliferation, or that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profilling a compound sectivity; (11) a culture comprising strains in which the test compound that inhibits proliferation of an organism; or (13) identifying the target of a compound that inhibits the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids are prequired for cellular proliferational New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs. drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from MUPO at firmy howlpublished_pct_sequences Antisense; prokaryotic essential gene; cell proliferation; drug design.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a proincerably linked to the nucleic acid cacid (1) a vector comprising a promoter operably linked to the nucleic acid cacid; (2) a host cell containing the vector; (3) an isolated continued a polypeptide whose expression is inhibited by the antisense uncleic acid; (4) an antibody capable of specifically binding the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation or the activity of a gene in an operon required for proliferation or the that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological contains a gene product or that has an activity gainst a biological pathway in which a proliferation-required gene or its gene product is oversive compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound it activity; (11) a culture compound that inhibits proliferation of compound its crivity; (11) aculture compound that inhibits proliferation of the strains is present in a culture or collection of the which each of the strains is present in a culture or collection of the which each of the strains is present in a culture or collection of the proliferation of an organism. The antisense nucleic acids required corrections or screening for homologous nucleic acids required corrections. The adultat promoter acids are useful for cellular proliferation in cells other candidate molecules for rational cert equired for proliferation in cells other sequence is encoded by one of required for proliferation in cells other enemediate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  screening
                                                                                                                                                                                                                                       Antisense; prokaryotic essential gene; cell proliferation; drug design.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Zyskind JW;

Also included are:

11 a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation; (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8)
                                                                                                                                                                                                                                                                                                                                                       screening
the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to an isolated nucleic acid comprising any one of

```
pathway in which a proliferation required possession of the broadcast pathway in which a proliferation required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts, (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, C. K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

```
The invention describes a new isolated nucleic acid encoding a Klebsiella pheumoniae polypeptide. Also described are: a recombinant expression vector comprising the nucleic acid, operably linked to a transcription regulatory element; and a cell comprising the recombinant expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New nucleic acid encoding a KlebBiella pneumoniae polypeptide, useful for preparing a vaccine composition against Klebsiella pneumoniae.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Disclosure; SEQ ID NO 13565; 932pp; English.

for improve the expression of rCOP-1 polypeptides in E. coli, genes coding for rCOP-1-77 were subcloned from pREV 2.1 to pBG3-2deltaN (deposit: 20-NOV-1984 US4691009, NRRL B-15910), a plasmid used to express Protein A. The resulting plasmids encode fusion proteins consisting of beta-glucuronidase, Protein A, and rCOP-1 sequences. A methionine residue cocurs between the Protein A and rCOP-1 sequences, originating from the fusion protein. rCOP-1-77 contains oligonucleotide may be cleaved from the fusion protein. rCOP-1-77 contains oligonucleotide duplexes incoding the following segments: YKK, EAE, KAK, AAK, and AAA. The N-terminal alamine residue is left behind following CNBr cleavage of the fusion protein. The product prevents or arrests experimental autoimmune encephalomyelitis. They are used to prevent, arrest or control a demyelinating disorder, e.g. multiple sclerosis. They may also be used as additives to hair care products to confer beneficial effects on damaged hair or as supplements for diets deficient in certain manno acids. See also AAQ05665. (Updated on 25-MAR-2003 to correct PA field.)

The present invention relates to a transporter system for delivering nucleic acid to a cell. The system comprises a nucleic acid binding complex, consisting of a binding molecule bonded non-covalently to the nucleic acid, and covalently to a surface ligand, and a lytic agent. The binding molecule is spermine or a spermidine derivative. Nucleotide sequences AAA36633-A36622 and peptide sequences AAA98456-Y98500 are used in the construction of the transporter system is used in gene therapy, particularly to deliver nucleic acids to hepatocytes, muscle cells or bone forming cells, e.g for transporter systems are also used to create transport and infection. The transporter systems are also used to create transport and infection. The transporter systems are also used to create transport and infection of the man carcinogenesis or disease or for drug testing). Other uses include transforming cells to produce proteins, or transfecting calls in vitro to study the function of the nucleic acid. The use of a surface ligand allows specific targeting of selected cells and tissues. The lytic agent provides for release of the nucleic acid into the cellular interior, from

The invention relates to a nucleic acid transport system (NTS) for delivering nucleic acid into a cell. The NTS contains but is not limited to 5 components: (a) the nucleic acid or a macromolecule to be delivered; (b) a moiety that recognizes and binds to a cell surface receptor or antigen or is capable of entering a cell through cytosis; (c) a nucleic acid or macromolecular molecule binding moiety; (d) a moiety that is capable of moving or initiating movement through a nuclear membrane; and/or c (e) a lysis moiety that enables the transport of the entire complex from the cell surface directly into the cytoplasm of the cell. The NTS delivers nucleic acid into the cellular interior as well as the nucleus of specific cells. The NTS can be used to treat disorders by targeting specific nucleic acid accordingly. The NTS can also be used to create transgenic animals for assessing human disease, such as cancer, in an animal model. The NTS can be used in vitro with tissue culture cells. The NTS can be used in vitro with tissue culture cells. The yes agent within the NTS avoids the problem of endosomal/lysosommal

This invention describes a novel system (I) for delivering a nucleic acid to a cell, comprising a binding complex comprising a ligand binding concovalently bound to a nucleic acid and covalently linked to a surface ligand, and a second binding complex comprising a second binding molecule noncovalently bound to a nucleic acid and covalently linked to a nuclear ligand. The complexes are simultaneously bound to the nucleic acid. The nucleic acid transporter system can also be used in a method for the in vivo targeting of the insertion of DNA into a cell. It can also be used in processes for producing transformed cell lines. The system can be used to deliver a variety or proteins and polypeptides, such as hormones, growth factors, enzymes, clotting factors, apolipoproteins, receptors, drugs, oncogenes, tumor antigens, tumor cupressors, viral antigens, parasitic antigens, and bacterial antigens. The transporter system uses lyaks agents to overcome the problems of endosomal/lysosomal degradation seen with prior art systems

The sequence represents poly-Lys-Ala, used to bind nucleic acid in a nucleic acid transporter system. The nucleic acid transporter system were nucleic acid binding complexes containing surface ligands which are capable of binding to a cell surface receptor and entering the cell through cytosis. The compounds of the invention are either ligands, binding molecules (surface ligands), lysis agents, spacer molecules or their intermediates. The ligands, binding molecules, lysis agents and spacer molecules are used in nucleic acid transporter systems to deliver nucleic acid into hepatocytes, muscle cells or bone forming cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Nucleic acid transport system, useful for creating transgenic animals for assessing human disease such as cancer in an animal model.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     26

Ohlsen KL, Forsyth RA,

the first and interaction where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular cross proliferation or the activity of a gene in an operon required for proliferation or that has an activity against a biological pathway to proliferation, (7) identifying a compound that influences the activity of pathway in which the test compound that proliferation of an identifying a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the gene or compound that inhibits proliferation of an organism. The antisense nucleic acids required for cellular proliferation to isolate candidate molecules for rational contraining proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational contragined for proliferation in cells other than S. arrens; crequired for proliferation in cells other than S. arrens; crequired for proliferation in cells other than S. arrens; crequired for proliferation in cells other than S. arrens; crequired for this prosential genes. Note: The sequence data for this screening The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression New antisense nucleic acids, useful for identifying proteins or scre for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs. Claim 25; SEQ ID NO 67145; 1766pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 5, Application US/09405743A

Sequence 5, Application US/09405743A

Patent No. 651433B

GENERAL INFORMATION:

APPLICANT: Yeda Research and Development Co., Ltd.

TITLE OF INVENTION: GLATIRAMER ACETATE MOLECULAR WEIGHT MARKERS

FILE REPERENCE: 60807-A

CURRENT APPLICATION NUMBER: US/09/405,743A

CURRENT FILING DATE: 1999-09-24

NUMBER OF SEQ ID NOS: 7

SOFTWARE: Patentin Ver. 2.1

SEQ ID NO 5

LENGTH: 77

TYPE: PRT

ORGANISM: Artificial Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             SYNTHETIC
                                                                                                          Sequence

Patent No. 6610836
GENERAL INFORMATION:
APPLICANT: GALY Breton et. al
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO KLEBSIELLA
TITLE OF INVENTION: NUMBER: US/09/489,039A
TITLE REFERENCE: 2709.2004001
CURRENT APPLICATION NUMBER: US/09/489,039A
CURRENT PILING DATE: 1090-01-27
PRIOR APPLICATION NUMBER: US 60/117,747
PRIOR APPLICATION NUMBER: US 60/117,747
SEQ ID NO 13565
LENGTH: 469
                                                      4

APPLICANT: Marc J. Rubenfield et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
TITLE OF INVENTION: ABRUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION: UMBER: US/09/252,991A
CURRENT APPLICATION NUMBER: US/09/252,991A
CURRENT PILING DATE: 1998-02-18
PRIOR APPLICATION NUMBER: US 60/074,788
PRIOR APPLICATION NUMBER: US 60/094,190
PRIOR FILING DATE: 1998-07-27
NUMBER OF SEQ ID NOS: 33142

C;Species: Trypanosoma cruzi
C;Date: 100v-1992 #sequence_revision 10-Nov-1992 #text_change 09-Jul-2004
C;Accession: E60110
R;Hoft, D.F.; Kim, K.S.; Otsu, K.; Moser, D.R.; Yost, W.J.; Blumin, J.H.; Donelson, J.E.;
Infect. Immun. 57, 1959-1967, 1989
A;Fitle: Trypanosoma cruzi expresses diverse repetitive protein antigens.
A;Fitle: Trypanosoma cruzi expresses diverse repetitive protein antigens.
A;Accession: E60110
A;Status: not compared with conceptual translation
A;Molecule type: mRNA
A;Residues: 1-219 <HOF>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               histone HI - Chlamydomonas reinhardtii

"Filamentous phage infection: crystal structure of g3p in complex with
its corceptor, the C-terminal domain of TolA.";
Structure 7:711-722(1999).
-!- FUNCTION: Involved in the tonB-independent uptake of group A
colicins (colicins A, B1, E2, B3, and K). Necessary for the
colicins to reach their respective targets after initial binding
to the bacteria. Also involved in the translocation of
                                                                                                                                                                                                                                                                                                                                                                                                                    Periplasmic (Potential).

DOMAIN II (ALPHA-HELICAL).

DOMAIN III (FUNCTIONL).

13 tandem repeats of [EDA]-K(1,2)-A(2,4).
                                                                                                                                                                                                                                                                                                                                                                                    Inner membrane; Protein transport; Repeat; Transmembrane; Transport.
1 13 Cytoplasmic (Potential).
RRANSMEM 14 34 Potential.
